Executive Summary

Study Objectives

The objective of this 6-week, randomized, examiner-blind clinical trial is to evaluate the safety and efficacy of Test OraCare Health Rinse compared to tooth brushing alone for the reduction of gingivitis and plaque when used unsupervised, twice daily at home.

The efficacy endpoints are:

Mean change in MGI at Weeks 2 and 6 for:

- Whole Mouth
- Interproximal (mesial and distal)

Change in mean number of healthy sites (MGI=0,1) from Baseline (MGI=2,3,4) at Week 2 and Week 6

Mean change in EBI scores at Weeks 2 and 6 for:

- Whole Mouth
- Interproximal (mesial and distal)

Mean change in number of bleeding sites (EBI=1 or 2) from Baseline to “0” bleeding sites at Weeks 2 and 6 for:

- Whole Mouth
- Interproximal (mesial and distal)

Mean change in LSPI scores at Weeks 2 and 6 for:

- Whole Mouth
- Gumline
- Interproximal (mesial and distal)

Mean change in BOP and scores and Periodontal Pocket Depth (PPD) at Week 6 for:

- Whole Mouth
- Interproximal (mesial and distal)

All efficacy variable results will be discussed in this Executive Summary.

Subjects were enrolled into one of two treatment groups. The treatment groups are:

- Control Group: Twice daily brushing with an ADA reference manual soft toothbrush plus ADA accepted dentifrice
- Test Group: Marketed OraCare Rinse following twice daily brushing with an ADA reference manual soft toothbrush plus ADA accepted dentifrice

Assessments were done at baseline, a 2-Week assessment, and a 6-Week assessment. For the purpose of labelling and identifying the two (2) groups, the text ‘Control’ will be used for the Control Group, and ‘Test’ will be used for the Test Group. The term ‘Plaque’ may be used to describe the Turesky Modification of the Quigley-Hein Plaque Index as further modified by Lobene and Soparkar (LSPI).

Demographic and Baseline Data

Sixty-five (65) subjects were randomized and sixty (63) completed the study. The demographic data will be presented for the enrolled subjects. The gender breakdown was 47 females and 18 males. The mean age was 48.8 years with the minimum age being 20 years and the maximum being 74 years. Demographic characteristics were comparable among the treatments at baseline. Full demographic summary data are given in Appendix Table 1.

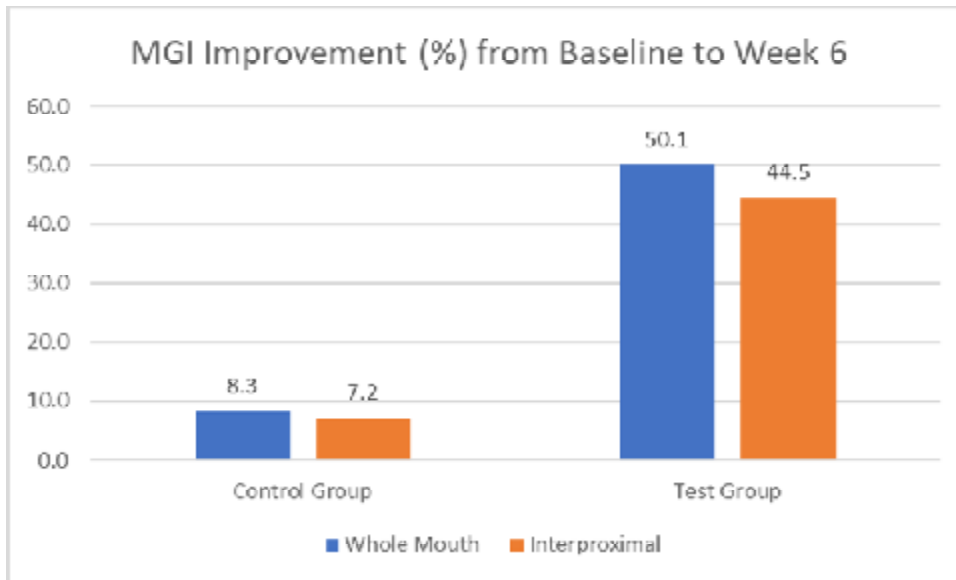

Study Results

The 6-Week results of the Modified Gingival Index (MGI), the Expanded Bleeding Index (EBI), and the Turesky Modification of the Quigley-Hein Plaque Index as further modified by Lobene and Soparkar (LSPI) showed that the Test group improved during the study ($p < 0.001$). The active treatment was statistically superior to the Control in biofilm reduction ($p < 0.001$, all LSPI endpoints) and resulted in better gingival health ($p < 0.001$, all MGI and EBI endpoints, except mean number of healthy bleeding sites at 2-weeks, $p = 0.044$). This superiority in efficacy

occurred at both the 2-Week evaluation and the 6-Week evaluation. Also, Bleeding on Probing (BOP) and Periodontal Pocket Depth (PPD) at Week 6 for the active treatment showed statistically significant less bleeding on probing ($p < 0.001$), and pocket depth improvement ($p < 0.001$) in the 6-Week Study. Also, the active rinse was statistically superior to the Control group for BOP ($p < 0.001$) and PDD ($p < 0.001$).

Executive Summary Figure 1 below shows the 6-Week MGI improvements. The active treatment was about 6-times more effective in MGI improvement during the 6-week study (as well as 5-times more effective at 2-weeks) for whole mouth and interproximal sites compared to the Control group ($p < 0.001$; for whole mouth, and interproximal sites, see Appendix Table 10).

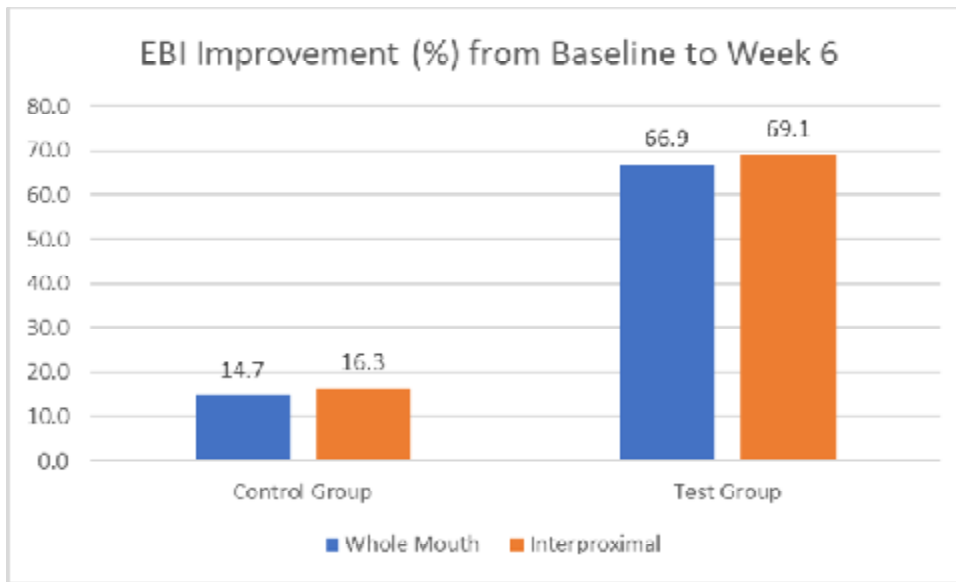

Executive Summary Figure 1: MGI Improvement: Baseline to Week 6

Results for the change in the number of MGI healthy sites followed the pattern seen for the MGI data. The change in healthy site for the active rinse was about 22 (adjusted for missing sites) ($p < 0.001$), whereas, the Control group added less than 1 healthy site during the study. The superiority in change to healthy sites for the Test group was statistically significant ($p < 0.001$) compared to the Control.

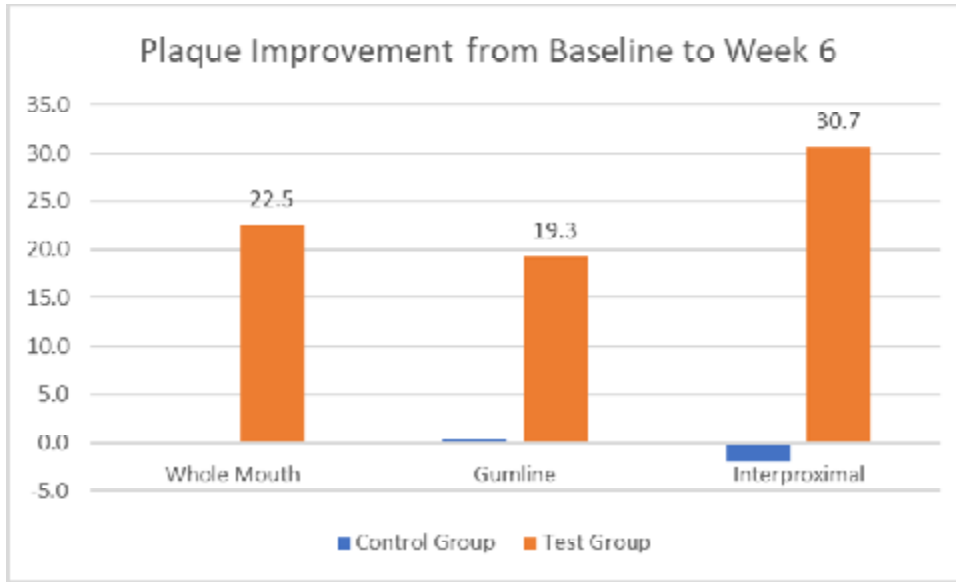

As seen in Executive Summary Figure 2 below the active treatment showed positive improvements for Expanded Bleeding Index (EBI) and was far superior to the Control Group ($p < 0.001$; for whole mouth, and interproximal sites, see Appendix Table 11).

Executive Summary Figure 2: Expanded Bleeding Index Improvement: Baseline to Week 6

Change to healthy bleeding sites increased by about 50% (adjusted for missing sites) ($p < 0.001$) for the active treatment (about 31 sites), whereas, the Control group added approximately 21 healthy sites during the 6-week study (see Appendix Table 4 and Table 5). The superiority in change to healthy sites was statistically significant ($p < 0.001$) at Week 6 compared to the Control (Appendix Table 15).

Executive Summary Figure 3: Plaque (LSPI) Improvement: Baseline to Week 6

(Control Group values: Whole mouth, -0.2; Gumline, 0.5; Interproximal, -1.9)

As seen in Executive Summary Figure 3 above the active treatments showed positive improvements for biofilm reduction and was far superior to the Control Group ($p < 0.001$; for whole mouth, gumline and interproximal sites, see Appendix Table 16). In fact, the Control group did not show any change in plaque during the 6-week study (see Appendix Table 6).

Summary

- The active treatment provided very positive outcomes towards gingival health over the 6-week study with about 6-times the improvement seen for the Control group.
- The active treatment increased about 22 healthy MGI sites compared to less than 1 site for the Control group.
- The active treatment provided very positive outcomes towards plaque biofilm removal over the 6-week study with a 22% improvement in whole mouth compared to no improvement for the Control group.
- The active treatment showed in excess of 35-times improvement in the Periodontal Pocket Depth compared to the Control group.

- The active treatment rinse showed superiority for every endpoint evaluated in comparison to the Control group.

Statistical Report

The body of this report will include sections and results that have not been discussed in detail in the Executive Summary. For the study synopsis, inclusion and exclusion criteria, analysis endpoints, and statistical analysis methods see the Executive Summary and / or the Protocol.

Study Design

See the Protocol and Study Report.

Statistical Analysis

See the Protocol and Study Report

Data Displays

Computer-generated tables adhere to the following specifications. Unless otherwise specified, the estimated mean for a set of values should be printed to two more decimal place than the raw (observed) data and rounded appropriately. Standard errors should be printed to three more additional decimal places than the raw (observed) data and rounded appropriately. For example, for plaque (i.e., data in integer values) data presentations will follow the following example given below.

Parameter	Data Presentation in Output
Raw data (e.g., plaque data)	X
Mean	X.XX
Standard Deviation (Standard Error)	X.XXX
Min - Max	X.XX – X.XX

The p value will be printed in tables rounded to three (3) decimal places and formatted as '0.xxx'. P values less than 0.001 will be formatted in the tables as 'p<0.001'. All fractional numeric values are printed with a zero to the left of the decimal point (e.g., 0.8). A percentage of less than one hundred is printed to a least two decimal places. Summaries are provided in

Executive Summary Tables, and Appendix Tables in this report. Improvement summaries and comparisons will be provided in tables. Tables providing summary statistics (e.g., mean, standard deviation, and comparisons of treatment change) will appear in the Appendix.

Results

Safety

No safety issues arose during the conduct of the study. Examination of the oral cavity at baseline, Week 2 and Week 6 assessments indicated normal findings for: perioral area / lips; buccal, labial, and sublingual mucosa, gingiva free/attached, tongue, palate hard/soft, uvula, oropharynx, and other soft / hard tissue. There were no adverse events during the conduct of the study.

Modified Gingival Index

All endpoints for the Test group improved over the study ($p < 0.001$; see Appendix Table 2 to Table 3) and the improvements were greatly superior to the Control ($p < 0.001$, see Appendix Tables 10 to 12).

The change (% improvement) in MGI and EBI and change in the number of healthy sites for MGI are given in Table 1 below. MGI improvements at Week 6 for whole mouth and interproximal sites were about 6-times the improvement seen in the Control group.

Table 1: Change (% improvement) in MGI and EBI and Change (Number) of Healthy Sites

Table 1						
	MGI Whole Mouth	MGI Interproximal	Healthy MGI ¹	EBI Whole Mouth	EBI Interproximal	Healthy EBI ²
Control						
2-Week	6.1%	4.6%		20.1%	16.0%	23.3
6-Week	8.3%	7.2%	0.07	14.7%	16.3%	21.0
Test						
2-Week	33.0%	27.9%		60.0%	61.7%	28.8
6-Week	50.1%	44.5%	20.6	66.9%	67.9%	30.7
1 Change in mean number of healthy gingival sites adjusted for missing sites.						
2 Change in mean number of healthy bleeding sites adjusted for missing sites						

Expanded Bleeding Index

All endpoints for the active treatment Test improved over the study ($p < 0.001$; see Appendix Table 4 and Table 5) and the improvements were greatly superior to the Control ($p < 0.001$; except mean number of healthy bleeding sites at 2-weeks, $p = 0.010$). Improvements were about 4.5-times greater for the active treatment compared to the Control group at Week 6.

The change in the number of healthy sites for EBI are given in Table 1 above. EBI improvements to healthy sites at Week 6 for whole mouth interproximal sites and were about 50% greater than the improvement seen in the Control group (about 31 compared to about 21). These differences are statistically significant ($p < 0.001$). The 2-week improvement was also significantly better for the Test group compared to the Control group ($p = 0.044$).

Plaque (LSPI)

Plaque results given in Table 2 below.

Table 2: Mean change (%) in Plaque (LSPI), BOP and PPD

Table 2							
	LSPI Whole Mouth	LSPI Gumline	LSPI Proximal	BOP Whole Mouth	BOP Proximal	PPD Whole Mouth	PPD Proximal
Control							
2-Week	-0.1%	-0.4%	0.7%				
6-Week	-0.2%	0.5%	-1.9%	-7.1%	-12.6%	0.2%	0.4%
Test							
2-Week	23.7%	19.8%	33.4%				
6-Week	22.5%	19.3%	30.7%	66.7%	66.2%	8.9%	7.4%

Plaque did not statistically change from Baseline for the Control group ($p > 0.504$; Appendix Table 6). Week 6 plaque improvements for the active treatment was very positive, whole mouth biofilm improvement for the Test group was 22.5%.

Plaque (whole mouth, interproximal, and gumline) for the Test group improved over the study ($p < 0.001$; see Appendix Table 6 and Table 7) and the improvements were superior to the Control ($p < 0.001$, see Appendix Tables 16 and Table 17).

Bleeding on Probing

Table 2 above shows that the Control group regressed in BOP during the study, while the active treatment had major gains in BOP (66.7% whole mouth improvement for the Test group). All BOP assessments for the active treatment improved over the study ($p < 0.001$, see Appendix Table 8) and the improvements were greatly superior to the Control ($p < 0.001$, see Appendix Tables 18).

Periodontal Pocket Depth

Table 2 above provided summary data for PDD. The Test group showed a 35-times improvement in the PDD compared to the Control group.

All PPD assessments for the active treatment improved over the study ($p < 0.001$; see Appendix Table 9) and the improvements were statistically superior to the Control group ($p < 0.001$, see Appendix Tables 19).

Conclusion

- The active treatment provided very positive outcomes towards gingival health over the 6-week study with about 6-times the improvement seen for the Control group.
- The active treatment increased about 22 healthy MGI sites compared to less than 1 site for the Control group.
- The active treatment provided very positive outcomes towards plaque biofilm removal over the 6-week study with a 22.5% improvement in whole mouth compared to no improvement for the Control group.
- The active treatment showed in excess of 35-times improvement in the Periodontal Pocket Depth compared to the Control group.

- The active treatment rinse showed superiority for every endpoint evaluated in comparison to the Control group.
